Sales Performance - Key Observations:

This set comprises **total sales worth $118.73M**, leading to a **profit value of $16.89M**, which is around 14% margin.

Across countries: The United States ranks first, with Canada, France, and Germany coming after it, while Mexico lags behind them in terms of sales among the five. The difference is not very large across the five countries; hence, this is a relatively well-balanced mature market and not a single country dominating the business.

Across segments: The government is the segment which earns maximum profit, earning way above others put together. Small Business is the next biggest segment, though on a smaller scale. Enterprise and Midmarket earn the least among all the segments; this needs to be kept in mind whether these are low value segments or low resource segments.

With respect to time: The sales drop through mid-year, rise suddenly to hit a peak in October, and decline again in the later part of the year. This is clearly a case of seasonality and not randomness, which calls for some inventory/campaign planning ahead of time.

From the regression analysis: The best predictors for Sales were Units Sold and Sale Price, which makes sense because sales are basically units multiplied by price.

Recomendation: Focus even more on the Government segment because of its significant profit contribution, and find out what exactly causes the peak during October (seasonality, discounting, etc.), as the replication of this effect at other times of the year can increase sales considerably.
